

Salimon Oluwatoyin Ayanleye

INFRASTRUCTURE SECURITY ENGINEER

salimon.ayanleye@outlook.com · +31 644 04 16 85 · nulcell.com · linkedin.com/in/toyin-ayanleye · The Hague, Netherlands

SUMMARY

Infrastructure security engineer with four years across security, cloud and data engineering. I secure a regulated fintech platform of roughly 200 Kubernetes clusters, 60 ECS clusters, 60 AWS accounts, 20 GCP projects and 2 Azure subscriptions, own runtime security and CNAPP across it, and threat model nearly every new infrastructure change. I built the in-house vulnerability management platform the company now reports from, and I lead the infrastructure security side of the SOC 2 audit. A background in penetration testing and bug bounty work still shapes how I review a system.

SKILLS

Cloud and platform	AWS, GCP, Azure, Kubernetes, ECS, Lambda, Docker, Terraform
Runtime and workload security	Sysdig, CNAPP, admission control, IaC scanning, container security
Security engineering	Threat modelling, architecture review, vulnerability management, security automation, incident response
Identity, network, endpoint	Okta, Netskope, DLP, Fastly WAF, macOS CIS baselines
Compliance	SOC 2 Type II, ISO 27001, audit coordination, policy development
Languages and tooling	Python, Go, Bash, SQL, GitHub Actions, AWS CDK, CloudFormation, Git, Burp Suite Pro

PROFESSIONAL EXPERIENCE

Security Engineer II (Infrastructure Security)

Nov. 2024 – Present

Mambu Tech B.V., Amsterdam, Netherlands

- Estate:** Security for around 200 Kubernetes clusters, 60 ECS clusters, 60 AWS accounts, 20 GCP projects and 2 Azure subscriptions, supporting engineering teams across the organisation.
- Runtime security and CNAPP:** Own runtime security across the estate using Sysdig, covering workload detection, admission control, policy controls and IaC scanning in build pipelines.
- Vulnerability management platform:** Built an in-house vulnerability database and ETL pipeline that manages vulnerabilities autonomously across 25,000+ infrastructure resources, including 5,000+ hosts and 20,000+ Kubernetes containers, serverless functions and ECS Fargate tasks. It handles triage and ticketing without manual review and is now the single source of truth for vulnerability reporting to managers, directors and external auditors.
- Threat modelling and architecture review:** Threat model nearly all new infrastructure changes. Around 20 systems taken through a formal capability readiness checklist and documented architecture review sessions that record gaps and their mitigations.
- SOC 2 Type II and ISO 27001:** Leading the infrastructure security workstream for the 2026 SOC 2 Type II audit as main point of contact, after shadowing the previous cycle. Infrastructure security controls also feed the ISO 27001 programme.
- Endpoint, data protection and on-call:** DLP and macOS CIS baseline controls for all internal users. On-call one week in three, 24/7, for infrastructure security incidents and issues caused by security components.

Cloud Engineer

Dec. 2023 – Oct. 2024

AMMP Technologies B.V., Amsterdam, Netherlands

- ISO 27001:** Ran the certification process end to end, from control implementation through to audit, and achieved certification.
- Vulnerability management:** Reduced impactful vulnerabilities by around 60%, mainly by improving triage and prioritisation so effort went to the fixes that mattered, supported by Vanta and SAST in CI/CD.

- **CI/CD:** Redesigned pipelines across multiple services with GitHub Actions, CloudFormation and CodePipeline, improving deployment efficiency by about 30%.
- **Cloud cost and architecture:** Cut AWS costs by around 15% through ARM64 migration, resource right-sizing, consolidation and refactoring of expensive data pipeline services.
- **InfluxDB migration:** Moved InfluxDB from a monolithic EC2 setup to an ECS cluster, improving performance by about 20% and cutting that service's operational costs by around 25%.

Data Engineer

Jun. 2022 – Dec. 2023

AMMP Technologies B.V., Amsterdam, Netherlands

- **Data acquisition services:** Built and deployed 20+ serverless applications and 10+ containerised Python services, increasing data processing speed by around 40% and reducing downtime by 15%.
- **Python libraries:** Created and maintained the internal libraries behind API integration and data processing, used across the acquisition services.
- **Cost optimisation:** Reduced AWS operational costs by around 20% through memory tuning, resource allocation and migration to ARM64 compute.

PROJECTS

Meridian — Source-available system of record for security decisions, written in Go. Scanners detect, but nothing owns what the team decided. Meridian covers risk acceptance with approvals and expiry, remediation validated against live findings, and evidence export for auditors in one call. In development, public release pending.

homecloud — Bare metal Kubernetes homelab running self-hosted services, including my portfolio and public status page. github.com/nulcell/homecloud

CERTIFICATIONS

- AWS Certified Security – Specialty | Aug. 2024
- AWS Certified Solutions Architect – Professional | Oct. 2024
- KCNA – Kubernetes and Cloud Native Associate | Aug. 2025
- HashiCorp Certified: Terraform Associate (003) | Jan. 2025
- AWS Certified Solutions Architect – Associate | Nov. 2023
- AWS Certified Cloud Practitioner | Jul. 2023

EDUCATION

University of Ibadan | BSc Electrical and Electronics Engineering | 2023

Cybersecurity Lead, Google Developer Student Club, UI Chapter

ACTIVITIES AND AWARDS

M4xH3dr00m | Team member | Jun. 2021 – Present

Ethical hacking, security research and security tool development. Earlier offensive work includes HackerOne bug bounty findings, among them critical XXE and SSRF vulnerabilities, and freelance web application security testing before moving into cloud engineering.

Cybersecurity Hackathon, American Business Council | 2021

Nigerian National Cyber Security CTF, CyberTalents | 2021
